

WCHQ Updates its Performance Measures

The Wisconsin Collaborative for Healthcare Quality (WCHQ) has recently updated its performance measures in many areas including Patient Experience and two new measures - Depression Screening and BMI Screening. All of WCHQ's publicly reported measures can be accessed at <http://www.wchq.org/reporting/>

Updated WCHQ Measures

1. [Depression Screening](#)
2. [BMI Screening Annually](#)

Updated Patient Experience Measures

The Wisconsin Collaborative for Healthcare Quality (WCHQ) has recently updated its patient experience measures.

These measures are generated from patient responses to surveys about their experience of care and indicate the percentage of patients who reported the best possible experience with their care.

Through this public reporting of patient experience, the healthcare provider organizations within WCHQ's membership are advancing their commitment to transparency in quality of care and future improvement.

About WCHQ Measures

The Wisconsin Collaborative for Healthcare Quality (WCHQ) has developed a unique set of healthcare performance measures to evaluate key primary care practices.

WCHQ's healthcare performance measures distinguish themselves from those created by other organizations, because they assess the care received by all of a provider's patients regardless of who pays for the services. By upholding the principle, "All Patients; All Payers; Always," WCHQ builds provider confidence in performance measurement and supports quality improvement efforts.

WCHQ member organizations—which include Wisconsin health systems, medical groups and hospitals—play an important role in crafting and refining the WCHQ performance measures. Beyond collecting the data to report, they also collaborate with WCHQ staff and participate in a systematic validation process to ensure the accuracy of performance data reported on the WCHQ website.
